

New Correctional Facility for Women Construction Update for February 10, 2017

We have completed construction weeks #45 & #46 of the new Correctional Facility for Women in Concord.

The interior concrete and steel ceiling areas continue to be fire proofed with a non-asbestos type spray on materials that the tradespeople affectionately call "Beam Cheese" because of its texture. (Picture below of the Beam Cheese)

The HVAC systems continue to be installed at all ends of the facility. The ductwork is massive and contains thousands of feet of galvanized sheet metal duct of various sizes and shapes. Even though the ducts are made of light gauge metal sheeting there is a total weight of 76,000 lbs. of ductwork to be hung in the facility, 14,000 lbs. of which has been installed thus far.

We continue to be on schedule and within budget with substantial completion in the fall of this year.

Jonathan. K. Hanson, Administrator of Logistics, 271-1888
